

ABEM Certification Examination Pass Rates by Residency Program

The following report provides information on how residency programs accredited by the Accreditation Council for Graduate Medical Education (ACGME) performed on the Emergency Medicine Qualifying Examination (QE) and the Oral Certification Examination (OCE). The report is organized alphabetically by state, followed by city.

For each residency program listed in this report, the report provides 5 data lines for each assessment. The data lines consist of 3-year average pass rates (e.g., 2021-2023) for all first-time takers who graduated during each timeframe. The reason for doing this is to decrease the influence of an outlier year and to protect the confidentiality of individual outcomes, especially at smaller programs. Caution should be exercised when interpreting pass rates, particularly for programs with fewer than 25 examinees over a three-year period. In addition, each examination summary table contains the number of graduates from that program, the number of candidates who took each examination for the first time, the percentage of each cohort of candidates taking the exam for the first time, and the first-time pass rate for the program with its 95% confidence interval.

This report will be updated annually.

Which residents are included in the calculation of a program's pass rate?

Candidates are included in the computation of a program pass rate if they meet all the following conditions:

1. They were first-time takers (repeat takers are excluded).
2. The final year of training was in emergency medicine.
3. The data is restricted to categorical EM program graduates from ACGME-accredited programs only.

Please note that for programs with five or fewer examinees during the specified timeframes, only the total number of examinees is reported to protect the anonymity of individual examinees.

What are the limitations of the data?

Many factors influence a program's pass rate. Some are directly attributable to the program, such as curriculum, faculty, and resident selection criteria. Others relate to examinees and the examination and are beyond the control of the program, including study habits/preparation style, personal (employment) responsibilities, personal circumstances, and prior performance on high-stakes exams. In contrast, examination factors include the specific content sampled in any year's test.

Other limitations may also affect the precision of the data. First, programs with smaller numbers of examinees will have less stable results. In this context, "less stable" means that smaller programs may exhibit higher variation in their year-to-year pass rates due to the relatively greater influence of individual examinees. Second, if significant changes have occurred in the program within the past three years, pass rates may not fully reflect these changes.

To interpret the data, start by looking at the “Residents Graduated” column, which tells you how many residents completed their emergency medicine training in a specific 3-year period. The “First-Time Test Takers” column shows how many of those graduates took the certifying exam for the first time.

The “Candidates Taking Exam (%)” indicates the percentage of graduates who chose to take the exam immediately after graduation. This can help you understand if most graduates are attempting certification promptly, or if a significant number are delaying or not taking the exam.

The First-Time Pass Rate is calculated by dividing the number of first-time test takers who passed by the total number of first-time test takers. Next to this percentage, you will see a range in parentheses—this is the 95% confidence interval.

Understanding Confidence Intervals

A confidence interval provides a range of values that is likely to contain the “true” pass rate for the population of interest. In this context, the 95% confidence interval means that if you were to repeat this process many times with new groups of graduates, 95% of the time, the “true” pass rate would fall within the range indicated.

For example, if a program’s first-time pass rate is reported as 90% with a 95% confidence interval of 80% to 98%, this means that while the observed pass rate is 90%, the true rate could reasonably be as low as 80% or as high as 98%. The width of the confidence interval depends mainly on the number of examinees. A smaller group will have a wider interval, reflecting greater uncertainty. In comparison, a larger group will have a narrower interval, indicating more precise estimates.

Programs that have fewer examinees (<25) will have wider and less reliable confidence intervals. Interpretation of pass rates in these circumstances will be less reliable from year to year. This variability highlights the importance of not drawing strong conclusions from small sample sizes, as a single individual’s result can significantly impact the overall rate.

In summary, these tables provide a snapshot of Emergency Medicine program performance on the Qualifying and Oral Certification Examinations, allowing for comparison across years and programs. The inclusion of confidence intervals helps convey the reliability of the reported pass rates, giving you a more nuanced understanding of the data.
